

Knights Key Transmission Replacement

The Florida Keys Aqueduct will begin construction installation of approximately 3100 FL of parallel transmission main where it crosses through Knights Key in Marathon. The existing transmission main in this area has a history of failure and is installed adjacent to an embankment wall, which presents a significant challenge to FCAA crews during repair. This project will allow FCAA to have redundant transmission main in the event that the new pipeline or old pipeline breaks. Construction is expected to be completed April 2026.
